Carbon Footprint Methodology

- The method for calculating the carbon intensity of a portfolio is a weighted average of greenhouse gas emissions divided by the EVIC of each position.
- The assessment of carbon intensity takes into account scopes 1 and 2 and 3 of greenhouse gas (GHG) emissions.
- We thus obtain the following formula:

$$\text{Carbon footprint of the portfolio} = \sum \left[\left(\frac{\text{Carbon emissions (scope 1 + 2 + 3)}}{\text{EVIC}} \right) \text{ of each security} \times \text{security weight} \right]$$

- Lazard Frères Gestion's fundamental approach, focused on stock selection, results in differences in sector exposures between funds and their benchmark indices.
