Carbon Footprint Methodology

- The method for calculating the carbon intensity of a portfolio is a weighted average of greenhouse gas emissions divided by the EVIC of each position.
- The assessment of carbon intensity takes into account scopes 1 and 2 and 3 of greenhouse gas (GHG) emissions.
- We thus obtain the following formula:

$$Carbon\ footprint\ of\ the\ portfolio\ = \sum \left[\left(\frac{Carbon\ emissions\ (scope\ 1+2+3)}{EVIC} \right) of\ each\ security \times\ security\ weight \right]$$

- Lazard Frères Gestion's fundamental approach, focused on stock selection, results in differences in sector exposures between funds and their benchmark indices.
